Module 3 — Homework: Improve Your Task Manager

Vistula University · IT Fundamentals · Homework

Estimated time: 30–60 minutes **Individual work** (each student submits their own commit and answers).

This homework builds on the `tasks.html` page from the lab.

Task 1 — Add a new field: Category (10–15 min)

Add one more field to your task form:

- A **category select** (`<select>`) with at least four options, for example: `Studies`, `Work`, `Home`, `Other`.

The category must:

- Appear in the task list next to the title, due date and priority.
- Be saved in **localStorage** together with the other fields (remember: localStorage lives only in this browser — that is fine for now; the shared database comes in Module 4).
- Be loaded back correctly when the page refreshes.

Task 2 — Improve the validation (10–15 min)

Your lab page already rejects an empty title and a title longer than 60 characters. Add at least **two** of these improvements:

- Reject a **due date in the past** with a clear error message, for example "The due date cannot be in the past."
- Require a **due date** (it cannot be empty).
- Show the error message **next to the field** it concerns, not only at the bottom of the form.
- Show a short **green confirmation message** ("Task added") for 2–3 seconds after a successful add.
- **Trim** the title (remove extra spaces at the start and end) before saving it.

Every rule you add must show a **visible, human-readable message**. Silent failure is not acceptable — the user must always know why the task was not added.

Task 3 — Write 5 sentences (10 min)

In a file called `REFLECTION.md` in your repository, write **exactly 5 sentences** in English answering:

> What happens, step by step, when the browser loads your `tasks.html` page?

Explain the order: **HTML** → **CSS** → **JavaScript**. Say what each of the three languages contributes, and mention what localStorage does when the page opens. Simple English is fine — correctness matters more than fancy words.

Hint from theory: the browser reads the HTML file and builds the page structure, then applies the CSS to style it, then runs the JavaScript — which loads your saved tasks from localStorage and shows them.

Task 4 — Commit and push (5 min)

Use a feature branch, as in the lab:

```
git switch main
git pull
git switch -c feature/homework-3
# ... make your changes ...
git add tasks.html tasks.js REFLECTION.md
git commit -m "Add category field, better validation, and load-order reflection"
git push -u origin feature/homework-3
```

Then open a Pull Request, merge it (a partner review is welcome but not required this time), and check that your GitHub Pages URL shows the new version.

Submission Instructions

Submit through the course platform on the assignment page (Assignments section): paste your GitHub repository URL / deployed app URL / PR URL as required.

1. **Repository URL** — your GitHub project.
2. **GitHub Pages URL** — the live link to `tasks.html`.
3. Confirm that `REFLECTION.md` is in the repository with your 5 sentences.

Deadline: before the next class (see the assignment page on the course platform).
